Active Constituents

Chlorpheniramine maleate 10 mg/mL (equivalent to 7 mg/mL Chlorpheniramine).

Actions

Chlorpheniramine is an antihistamine compound combining a high degree of potency and rapidity of action with a relative absence of undesirable side effects. Chlorpheniramine has 5 to 20 times the activity on a weight basis of other commonly used antihistamines such as mepyramine and promethazine. It also causes less sedation than the former compound.

Chlorpheniramine may be useful in allergic conditions due to abnormal histamine activation including dermatoses, insect bites and stings, nonspecific pruritus, urticaria and skin irritation in serum sickness and drug sensitivity; also supportive treatment in laminitis, azoturia, mastitis, lantana poisoning and milk fever.

Indications

For the treatment of allergic reactions in horses, cattle, sheep, goats, pigs, dogs and cats.
